Docket No.: 033988 R 002

IN THE CLAIMS:

Please amend claim 29 as shown below in the LISTING OF CLAIMS.

Claims 1-11 (cancelled)

Claim 12 (previously presented): A device for filtering ferromagnetic material from a fluid in

which said material is suspended, comprising a magnet and a pair of metal plates, said magnet

having faces of opposite magnetic polarity, each of said plates being disposed in abutment with a

respective one of said magnet faces, each of said plates comprising a plurality of recesses about

an outer perimeter of the plate to form radially extending magnetic pole pieces, which extend

beyond an outer perimeter of said magnet faces, said plates being oriented so that said recesses

and pole pieces on a first one of said plates are aligned with said recesses and pole pieces on the

second of said plates, wherein opposed recesses on said first and second plates define passage

means for said fluid and wherein opposed said pole pieces on said first and second plates define

regions to which ferromagnetic material is attracted and retained.

Claim 13 (previously presented): A device as claimed in claim 12, wherein said opposed recesses

on said first and second plates also define regions from which ferromagnetic material is repelled.

Claim 14 (previously presented): A device as claimed in claim 12, wherein said magnet and said

metal plates are each provided with a central hole which is adapted to receive a tube through

which fluid can pass, said tube providing means for isolating, within the device, fluid passage in

said tube from fluid flow through said recesses.

2

Claim 15 (previously presented): A device as claimed in claim 12, further comprising a distribution plate having a plurality of apertures which are alignable with said recesses, said apertures being the only passage means of fluid to said metal plates.

Claim 16 (previously presented): A device as claimed in claim 15, wherein said distribution plate, said magnet and said metal plates are each provided with a central hole which is adapted to receive a tube through which fluid can pass, said tube providing means for isolating, within the device, fluid passage in said tube from fluid flow through said recesses.

Claim 17 (previously presented): A device as claimed in claim 16, wherein an outer face of said tube is provided with a recess which can receive retaining means which is able to keep said distribution plate in abutment with an axially closer of said metal plates.

Claim 18 (previously presented): A device as claimed in claim 12, wherein the distribution plate is made of a non-ferromagnetic material.

Claim 19 (previously presented): A device as claimed in claim 12, wherein each of said recesses is further provided with one or a plurality of slots.

Claim 20 (previously presented): A device as claimed in claim 12, wherein an outer edge of each of said pole pieces is further provided with one or a plurality of slots.

Claim 21 (previously presented): A device as claimed in claim 12, wherein the outer edges of said facing pole pieces are curved towards one another.

Docket No.: 033988 R 002

Claim 22 (previously presented): A device as claimed in claim 12, further comprising means for

maintaining said recesses and said apertures in alignment.

Claim 23 (previously presented): A device as claimed in claim 12, wherein said magnet

comprises a material which will generate a magnetic field between said metal plates of sufficient

strength to attract ferromagnetic material from fluid passing therebetween.

Claim 24 (previously presented): A device as claimed in claim 12, wherein the metal plate which

is impinged first by fluid flow through the device is thicker than said other metal plate through

which said fluid leaves the device.

Claim 25 (previously presented): A device as claimed in claim 12, further comprising a housing

having means at one end for receipt by a containing means of said fluid, said containing means

comprising an input means and an output means, said housing having means at the other end to

receive a fluid filter, an output of which fluid filter is continuous with a fluid passageway passing

through an aperture in said magnet and also continuous with the input means to said containing

means, said output means from said containing means being continuous in said recesses in said

metal plates.

Claim 26 (previously presented): A device as claimed in claim 15, further comprising a housing

having means at one end for receipt by a containing means of said fluid, said containing means

comprising an input means and an output means, said housing having means at the other end to

receive a fluid filter, an output of which filter in continuous with a tube extending through an

aperture in said magnet and also continuous with the input means to said containing means, said

output means from said containing means being continuous with said apertures in said

distribution plate and said recesses in said metal plates.

4

Serial No.: 09/011,160 Docket No.: 033988 R 002

Claim 27 (previously presented): A magnetic filter device for filtering ferromagnetic material from a fluid in which said material is suspended, comprising a fluid filter, a magnet and a pair of metal plates, said magnet having faces of opposite magnetic polarity, each of said plates being disposed in abutment with a respective one of said magnet faces, each of said plates comprising a plurality of recesses about an outer perimeter of the plate to form radially extending magnetic pole pieces, which extend beyond an outer perimeter of said magnet faces, said plates being oriented so that said recesses and pole pieces on a first of said plates are aligned with said recesses and pole pieces on the second of said plates, wherein opposed recesses on said first and second plates define passage means for said fluid, and wherein said opposed pole pieces on said first and second plates define regions to which ferromagnetic material is attracted and retained, said filter having passage means for said fluid which is continuous with fluid passage through said recesses.

Claim 28 (previously presented): A magnetic filter device as claimed in claim 27, wherein said opposed recesses on said first and second plates also define regions from which ferromagnetic material is repelled.

Claim 29 (currently amended): A magnetic filter device as claimed in claim 27, wherein said fluid filter is positioned downstream of said magnet and said second pair of metal plates.

Claim 30 (previously presented): A process for filtering ferromagnetic material from a fluid in which said material is suspended, comprising passing said fluid through a device for filtering ferromagnetic material from a fluid in which said material is suspended, comprising a magnet and a pair of metal plates, said magnet having faces of opposite magnetic polarity, each of said plates being disposed in abutment with a respective one of said magnet faces, each of said plates

Serial No.: 09/011,160 Docket No.: 033988 R 002

comprising a plurality of recesses about an outer perimeter of the plate to form radially extending magnetic pole pieces, which extend beyond an outer perimeter of said magnet faces, said plates being oriented so that said recesses and pole pieces on a first one of said plates are aligned with said recesses and pole pieces on the second of said plates, wherein opposed recesses on said first and second plates define passage means for said fluid and wherein opposed said pole pieces on said first and second plates define regions to which ferromagnetic material is attracted and retained.

Claim 31 (previously presented): A process for filtering ferromagnetic material from a fluid in which said material is suspended, comprising passing said fluid through the device recited in claim 33.

Claim 32 (previously presented): A device for filtering ferromagnetic material from a fluid in which said material is suspended, comprises a magnet and a pair of metal plates, said magnet having faces of opposite magnetic polarity, said plates being disposed in abutment with said faces respectively, each plate having a plurality of recesses about an outer perimeter of each plate to form radially extending magnetic pole pieces, which extend beyond an outer perimeter of the magnet faces, said plates being oriented so that the recesses and pole pieces on one plate are axially aligned with those recesses and pole pieces on the other plate, wherein axially opposite recesses define passage means for said fluid and also regions from which ferromagnetic material is repelled, and wherein said pole pieces define regions to which ferromagnetic material is attracted and retained, said device being further provided with a distribution plate having a plurality of apertures which are axially alignable with said recesses, said apertures being the only passage means of fluid to said metal plates, wherein the distribution plate, the magnet and said metal plates are each provided with an aperture which is adapted to receive a tube through which fluid can pass, said tube providing means for isolating, within the device, fluid passage in the

Docket No.: 033988 R 002

tube from fluid flow through the recesses, and wherein each recess and an outer edge of each

pole piece is further provided with one or a plurality of slots.

Claim 33 (previously presented): A device for filtering ferromagnetic material from a fluid in

which said material is suspended, comprising:

a magnet having a first face and a second face with said faces being of opposite magnetic

polarity;

a first plate magnetically fixed to the first face of said magnet;

a second plate magnetically fixed to said second face of said magnet,

said first plate having a plurality of recesses about an outer perimeter of said plate to form

radially extending pole pieces which extend beyond an outer perimeter of the first face of said

magnet;

said second plate having a plurality of recesses about an outer perimeter of said plate to

form radially extending pole pieces which extend beyond an outer perimeter of the second face

of said magnet;

said first and second plates being arranged so that said recesses and pole pieces of said

first pate are aligned with respective recesses and pole pieces of said second plate, and wherein

opposed recesses on said first and second plates define passages for said fluid and wherein

opposite pole pieces on said first and second plates define regions to which said ferromagnetic

material is attracted and retained.

Claim 34 (previously presented): The device as recited in claim 33 wherein the recesses in each

of said first and second plates open out at spaced intervals about a peripheral edge of respective

plates.

7

Claim 35 (previously presented): The device as recited in claims 33 wherein said pole pieces have formed therein radial slots.

Claim 36 (previously presented): The device as recited in claim 33 wherein said recesses in said first and second plates are of a common configuration.

Claim 37 (previously presented): The device as recited in claim 36 wherein the pole pieces of said first and second plates are of a common configuration.

Claim 38 (previously presented): The device as recited in claim 33 wherein the pole pieces of said first and second plates are of a common configuration.

Claim 39 (previously presented): The device as recited in claim 33 wherein said metal plates are releasably fixed to said magnet and in direct contact with said magnet.

Claim 40 (previously presented): A method of filtering ferromagnetic material from a fluid in which said material is present comprising passing said material through the device of claim 34.

Claim 41 (previously presented): A method of assembling the device of claim 34 comprising fixing said first and second plates to said magnet.
